Resources for an ALL Careers approach to education  Martin Ogle (Martin@EntrepreneurialEarth.com)

Resources listed, below, are examples to be drawn upon to foster an **ALL Careers approach** where basic environmental principles are linked *explicitly* to how ALL careers can be envisioned, changed, and created. As of this writing, there are not many resources that bring together the “ALL Careers approach” in one place; that review principles of living systems and make direct connections to ALL Careers. Books on green careers provide valuable information, for example, but rarely cover principles of living systems or explicitly connect them to the careers they discuss. Also, these books discuss green careers as a (usually small) **subset** of the economy and do not have a vision of ALL Careers as green careers. That’s a big and important difference.

However, there are lots of resources to draw from to make the connections suggested by an ALL Careers approach. There are volumes written about environmental principles / principles of life, of course. There are quite a few books about “Green Economics,” “Green Careers,” etc. There are many resources that document case studies of businesses and other efforts that are changing the economy in healthy/sustainable directions. Most of these can and should be used, in part or whole, at the high school level. Use these in combination with ideas on how to advance an ALL Careers approach at [Actions to advance an ALL Careers approach](#).

**Websites:**

- [Environmental Literacy and ALL Careers](#) – a blog on the ALL Careers approach on my website.
- [Green 360 Career Catalyst](#) – “The Green 360 Career Catalyst enhances 8th-12th grade education programs and young adult training programs in career preparation and environmental sustainability. It provides digital tools, information, and resources for students to make informed career decisions and create pathways toward green careers.” This is an excellent website for teens even though it does not discuss actual principles of living systems. It starts with a questionnaire about one’s interests and aptitudes and suggests careers from a large number of “green career” choices.
- [Entrepreneurial Earth LLC](#) is Martin Ogle’s website at which much information and ideas relative to ALL Careers approach can be found. See also [Musings (blogs)](#)
- [Rich Earth Institute](#) - one among many great examples of businesses and organizations that are currently using principles of living systems to build whole new resource use pathways.
- [Doughnut Economics (Ted Talk by Kate Rayworth)](#)
- [The Capital Institute; Co-creating the Regenerative Economy](#)
- [Regenerative Design Principles](#) from nRhythm

**Books:**

*Cradle to Cradle: Remaking the Way We Make Things.* By Michael Braungart and William McDonough. 2002. Farrar, Straus and Giroux. A classic that talks about specific environmental principles and their relationship to a variety of jobs / careers.

*Principles of Sustainable Living – A New Vision for Health, Happiness and Prosperity.* By Richard Jurin. 2012. Human Kinetics. This textbook is written in a very accessible manner that discusses a wide range of human activities including our work and careers.
The Nature Principle; Reconnecting with Life in a Virtual Age. By Richard Louv. 2011. Algonquin Books of Chapel Hill. This book encourages young people to consider all careers as ones that can heal the human-nature relationship. The subchapter, “Making a Living and a Life” captures this idea. Louv has given me permission to use this phrase as the title for many ALL Careers programs I do.

You Can Farm; The entrepreneur’s guide to start and succeed in a farming enterprise. By Joel Salatin. 1998. Polyface Inc.

Y on Earth; Get smarter, feel better, heal the planet. By William Aaron Perry. 2017. Earth Water Press.

Sustainability At Work; Careers that make a difference. By Marilyn Waite. 2017. Routledge, Taylor and Francis Group. Although this book does not discuss all careers as green careers, it would be a good book for Career Counselors to consider to expand their own view of “green careers.”

The Decline of Pleasure. By Walter Kerr. 1962. Time Life Books – this is a book about human nature. Kerr writes about how the U.S. had (already in 1962) become defined by a utilitarian mindset in which everything we did had to have a purpose, most often towards the goal of efficiency and greater production.

Economics:

**Principles of Living Systems**

As mentioned in the introduction, there is an abundance of resources to help students learn about living systems. Existing textbooks used in environmental science and biology classes, for instance, provide good, scientific information, and there is a huge array of online (including video) resources. The key is in both ensuring that we enable ALL students to learn basic principles of living systems and that this knowledge is explicitly connected to ALL students’ ability to find, build and create their own careers.

Because knowledge is so fragmented today, it is also important that students begin to understand how Earth is a living system of which human beings are a seamless part. Thus, I wholeheartedly recommend the use of Gaia Theory as a context for education. See the following resources to learn more:

- [Overview of Gaia Theory](www.GaiaTheory.org)
- [Reading list for Understanding Gaia Theory](#)

**Energy** is the biggest nexus between human systems and Earth’s living systems. Thus, energy education is singularly important and a very important part of an ALL Careers approach. There are many, many excellent energy curriculum materials available. Start with [curriculum materials](#) from [National Energy Education Development (NEED)](#) as one example.

**Environmental Education**

Get connected to Environmental Education in Colorado through the Colorado Alliance for Environmental Education. Along with the Colorado Department of Education and the Colorado Department of Natural Resources, CAEE has developed the [Colorado Environmental Education Plan](#). This document “outlines strategies for building a feasible, cost effective, and sustainable infrastructure to support the education of an environmentally literate citizenry.” But it can only be effective if it is used. I believe that the most compelling context in which it can be used is through an ALL Careers approach. It is possible that the most likely way that environmental education will gain traction is if it is comprehensively connected to how we as a society envision a green economy and thus the “green career readiness” of students.

I also recommend the document [A Blueprint for Environmental Literacy: Educating Every Student In, About, and For the Environment](#). This was produced by the California State Superintendent of Public Instruction’s statewide Environmental Literacy Task Force. It is similar to the Colorado Environmental Education Plan in many ways, but makes more references to connections to careers. See, for instance, these goals from the document:

- ‘Establish a state-level advisory council that provides common messaging across the state regarding the value and importance of environmental literacy to formal education and career readiness.’
- ‘Showcase ways of utilizing curricular materials, local environmental literacy opportunities and connections with resource professionals to highlight “real world” examples and career pathways.’
